KnowPlace Production Management

Pushing to Production

In order to push code to production, you have to first commit your changes to your git repository. After committing your changes push to the production repository using the following command:

```
git push heroku master
```

Heroku takes down the server, recompiles all the source files, and runs the server.

Connecting to the Production Heroku Database

In order to connect to the KnowPlace Heroku production database, run the following command:

```
heroku pg:psql –a knowplace
```

In PostgreSQL, you can immediately run SQL commands on the database. Type \? for PostgreSQL specific commands.

Resetting the Production Heroku PostgreSQL Database

To reset the production database with your local reset script, run the following command in your local shell:

```
cat sql/reset.sql | heroku pg:psql –a knowplace
```
